SUBJECT: CSR/Mining

AUTHOR: Stiller, V., Engineer

TITLE: Ore Mining in the Chvaletice Open Mine (Dobycha rudy v Khvaletitskom kar'yere)

PERIODICAL: Gornyy Zhurnal, 1957, #10, pp 40-43 (USSR)

ABSTRACT: The Chvaletice deposit of iron-manganese ores and pyrite slates is located at the northern slope of the "Rudnyye" Gory. The iron-manganese ore body is of sedimentary origin and lies at a depth of 10 to 15 m from the earth surface, but outcrops in the north and south.

The content of manganese in the ore varies considerably, amounting to 10 to 15 % on the average; the sulfur content is 5 to 12 % and phosphorus content is about 1.5 %. The bottom and the roof of the ore body are mainly graphitized and consist of pyritic slates.

In the western part of the deposit, the ore body is represented by a syncline whose axis runs from north-west to south-east. The dip angle is 16°. The separation between the syncline wings

Card 1/3

187-10-9/24

TITLE:

Ore Mining in the Chvaletice Open Mine (Dobycha rudy v Khvaletitskom kar'yere)

is 250 m in the western part and about 550 m in the eastern part.

The Chvaletice ores can be divided into 4 main types by their hardness, abilities to be crushed and concentrated:

1. Very soft, graphitized argillites with a high content of bitumen and low content of coarse-grained pyrite;
2. Hard pyritic slates with a medium sulfur content;
3. So-called "compact pyrites", very hard slates with a high content of pyrite and considerable admixtures of manganese, and
4. Very hard iron-manganese ore.

The mining of this deposit requires very careful geologic prospecting which is being carried out by means of Soviet-manufactured drilling machines of the "ЭНБ" type. Bore holes, 50 to 60 m deep, are drilled with a considerable advancement with respect to operating stopes.

The ores are mined by means of explosives. Bore holes are drilled with Soviet drilling machines of the "ДГ-20-2" type.

Card 2/3

127-10-9/84

TITLE: Ore Mining in the Chvaletice Open Mine (Dobycha rudy v Khvaletitskom kar'yere)

The ore is loaded with "Mb-2" and "E-25" excavators.

Ore mining proceeds simultaneously in 3 operational benches while one bench is in reserve. The open mine is 800 m long.

The ore is transported in 6.3 m³ cars with side unloading, pulled by 200-hp locomotives. At present, 16 m³ dump cars are being introduced, and it is planned to replace steam locomotives by electric ones.

The daily ore output in 1955 was 4,135 tons and in 1956 was 4,279 tons.

The article contains 2 plans and 3 tables.

Thiosemicarbazones and 2-thio-4-(phthalimidoalkylidene)thiazolidin-5-ones of N-phthaloyl amino aldehydes. Preparation and antibacterial activity. J. Kolčev, N. Stinač, B. Suko, B. Balenović, and B. Urbas ("Pliva", Zagreb, Yugoslavia). *Arhiv kem.* 26: 71-8 (1964) (in English).—Six thiosemicarbazones, of phthalimidoaldehydes and five 2-thio-4-(phthalimidoalkylidene)thiazolidin-5-ones were prepd. and tested against *Staphylococcus aureus*, *Bacterium pyocyaneum*, *Escherichia coli*, and *Enterococcus* by the Food and Drug Administration method. Thiosemicarbazones showed activity, while the thiazolidones were generally inactive. Some of these compds. were tested also by the Oxford Cup Assay method against the same microorganisms. A new procedure for prepn. of 2-mercapto-2-thiazolin-5-one (I) is given. To 30 g. dried, finely powd. $H_2NCH_2CN \cdot H_2SO_4$, 30 ml. MeOH, and a small amt. of phenolphthalein indicator were added, a soln. of 7 g. Na in 150 ml. abs. MeOH dropped in with stirring during 0.5 hr. at 0° until a red coloration developed, the Na_2SO_4 filtered off and washed with 25 ml. abs. MeOH, the filtrates evapd. to 1/2, *in vacuo* under N at a max. temp. of 40°, alkalized with a few ml. MeONa soln., evapd. to dryness during 15 min. (max.), 1

ml. of a soln. of 0.1 g. Na in 3.5 ml. EtOH, then 17 ml. dry Me₂CO added, the mixt. allowed to stand 1 hr. and occasionally shaken to give solid 2,2-dimethyl-3-aminocyclohexane. This was dissolved in 20 ml. H₂O, evapd. in vacuo, dissolved in 125 ml. abs. EtOH, 7 ml. CS₂ added, kept overnight, and scratched to crystallize 20 g. II, NCOCH₂NHCS₂NH₂CH₂CONH₂, which was dried, powdered, and dissolved in 60 ml. concd. HCl at 0°, then 100 ml. H₂O were added and the mixt. let stand overnight at 0° to give 10 g. I, m. 300° (decompn.). By addn. of a satd. aq. soln. of II, NCSNH₂NH₂ to satd. EtOH solns. of various phthalimidoaldehydes (II), keeping the mixt. 48 hrs., and crystn. from 1:1 EtOH-H₂O, the following *o*-C₆H₄(CO)₂NCH₂CH₂NNHCSNH₂ were prepd. (R, optical configuration, and m.p. given): H, —, 213–13.5°; Et, —, 205.5–7°; MeCH₂, dl. 195–0°; EtOCH₂, dl. 193–6°; *p*-MeOC₆H₄CH₂, l. 142°; Me₂CH, dl. 205.5–0.5°. By condensing various II with I (cf. Billimoria and Cook, C.A. 44, 1960e) following dl-*o*-C₆H₄(CO)₂NCH₂CH₂C.NH.C(S).S.CO were prepd. (R and m.p. given): Me₂CH, 193–6°; EtOCH₂, 155.5–7°; Et, 182–3.5°.

Stimac, N

Preparation of O-alkyl-N-acyl-DL-serines. N. Stimac and B. Gaspert (Phila., Zagreb, Yugoslavia). *Ann. Chem.* 26, 105-7 (1954) (in English). — O-Methyl-DL-serine (11.9 g.) was heated with 14.8 g. α -C₆H₄(CO)₂O for 0.5 hr. at 160°, dissolved in 50 ml. MeOH, decolorized, 200 ml. H₂O added and let stand overnight at 0° to yield 21.5 g. O-methyl-N-phthaloyl-DL-serine, m. 140-1° (from MeOH-H₂O 1:3). Anilide of O-ethyl-N-phthaloyl-DL-serine was prepd. from α -phthalimido- β -ethoxypropionyl chloride and PhNH₂ in C₆H₆, m. 100° (from Et₂O). To a soln. of 4.0 g. of 1-diazo-4-ethoxy-3-phthalimidobutan-2-one in 20 ml. AcOH was added 5 ml. 48% HBr, let stand 1 hr., and 200 ml. H₂O added to yield 5.2 g. 1-bromo-4-ethoxy-3-phthalimidobutan-2-one, m. 50-52°, m. 91-5° (from CH₂Cl₂-petr. ether). p -MeC₆H₄SO₂Cl (1.9 g.) in 10 ml. Et₂O was added to a soln. of 1.33 g. O-ethyl-DL-serine (I) in 2N NaOH, stirred 48 hrs. at room temp. and the aq. layer acidified with 2N HCl to give 1.85 g. O-ethyl-N-(p -tosyl)-DL-serine, m. 121-4°, m. 131-2° (from H₂O). To a mixt. of 6.7 g. I, 5.95 g. MgO, 75 ml. H₂O and 25 ml. Et₂O, cooled to 0°, was added during 0.5 hr. 16.7 g. C₆H₅CH₂OCOC₂H₅, stirred 6 hrs., and filtered. The aq. layer was sepd., extd. twice with Et₂O, acidified with 2N HCl to sep. an oil, the aq. layers extd. with EtOAc, and combined with the oil, washed with 5% HCl and H₂O, dried and evapd. to leave 11.5 g. N-carbobenzoyl-O-ethyl-DL-serine, m. 62-7°, m. 73-4.5° (from EtOAc-petr. ether). R. Gustak

 Title : Microflora of Takys of the Kuniya-Dar'inskaya Plain
 Orig. Pub: Tr. In-ta pochvoved AN UzSSR, 1958, vy. 2, 219-239

Abstract: The general quantity of microorganisms in takys (gray and rose) is considerably less than in other USSR soils (52,000 per 1 g of soil), although diverse physiological groups of microbes are represented. The oligonitrogens occupy a primary position (10,000 per 1 g), being the basic nitrogen fixers in the takys. Their maximum number is observed in the crust layer; it decreases gradually with depth.

Bacilli form a large part of the total number of microbes, which is characteristic for soils of southern regions. Of the spore-bearing ammonifiers in the takys, Bac. mesentericus and Bac. idaeus predominate; they assimilate well the ammonium-nitrate salts contained in the soil. The denitrifiers are contained, in relatively high titers, in almost all horizons, often extending to a great depth; moreover, seasonal variations are not observed in their numbers. The nitrifiers clostridia, butyrate and cellulose-decomposing bacteria and the actinomycetes are found in small quantities. On the whole, these nitrifiers appear to be the basic stimulants of the first phase. Nitrifiers

Moskva, 14-18 Iyunya 1960 g.; doklady i avtoritarnyye
skazaniya III. (International Symposium on Macromolecular
Chemistry Held in Moscow, June 14-18, 1960; Papers and
Summaries) Section III. [Moscow, Izd-vo AN SSSR, 1960]
469 p. 55,000 copies printed.

Tech. Ed.: P. S. Kashina.

Sponsoring Agency: The International Union of Pure and Applied
Chemistry. Commission on Macromolecular Chemistry.

PURPOSE: This book is intended for chemists interested in poly-
merization reactions and the synthesis of high molecular
compounds.

COVERAGE: This is Section III of a multivolume work contain-
ing papers on macromolecular chemistry. The articles in
general deal with the kinetics of polymerization reactions,
the synthesis of specific-purpose polymers, e.g., ion ex-
change resins, semiconductor polymers, etc., methods of cat-
alyzing polymerization reactions, properties and chemical
interactions of high molecular materials, and the effects of
various factors on polymerization and the degradation of
high molecular compounds. No personalities are mentioned.

Agrochemical characterization of some peat beds in Romania. Gr. Obrejaanu, N. Stăsa, and V. Blănuș. Acad. rep. populare Române, Bul. (1959). Sec. biol. și inž. agr. 8, 800-15 (1959).—Peat beds from different parts of Romania were studied for their compn. in view of their utilization in agriculture. The ratio C/N is an indication of the state of decompn. of the various materials in the peat beds. There was a good correlation in the degree of decompn. detd. macroscopically and some limits of variation of the C/N. Values of C/N are given for the peat beds studied.

TITLE: Mechanical Testing of Plastics. 3. Fatigue Tests

PERIODICAL: Plasticheskiye massy, 1960, No. 9, pp. 54 - 61

TEXT: The present investigation bases on a paper read by S.B.Ratner at the Conference on the Practical Use of Plastics in Building. This paper treated the physical characteristics of the mechanical properties of plastics and the specificity of their testing methods. Owing to the great interest taken in this subject, the lecture material for publication was supplemented and subdivided into five communications. The first two of these were published in 1960, in the numbers 7 and 8 of this journal. At the outset, the essential difference between the fatigue of plastics and the fatigue of metals is stressed. The present-day methods applied in fatigue tests are divided into two groups differing in type of index and design of testers. The tests in question are the tests of hard plastics and soft plastics. The methods and testing machines used for testing hard plastics are essentially the same as are used for metal testing

(Figs.1 - 5, Table 1). The machine by De-Mattia, generally applied for testing rubber, is used for testing soft plastics in the form of thin, flexible sheets and films, etc. (Fig.6, Table 2), (Refs.15 and 16). Data obtained at the Fiziko-mekhanicheskaya laboratoriya NIIPM (Physico-mechanical Laboratory of the Scientific Research Institute of Plastics) permit the following conclusions to be drawn: The fatigue curve of plastics at harmonic stress usually has the shape of the curve according to Veler. The only difference is that it does not approach the horizontal asymptote, as is the case for most metals. This generally known conclusion also holds for the plastics investigated. Testing of hard plastics was carried out by means of the MYM-6000 (MUI-6000) machine and, in collaboration with the TsNIITMASH (Central Scientific Research Institute of Technology and Machine Building), by means of a Y-12 (U-12) machine. The fatigue coefficients K (the percentage of remaining strength σ relative to the static strength P) of glass-reinforced plastics and unfilled polymers vary widely. After 10^6 - 10^7 stress cycles the fatigue coefficient of unfilled plastics averages 10%, while for glass-reinforced plastics it lies around 20 - 35%. The approximate constancy of the fatigue coefficient within one group of plastics indicates the

Card 2/4

Mechanical Testing of Plastics. 3. Fatigue Tests

S/191/60/000/009/006/010
B013/B055

decisive role of static strength for fatigue. The knowledge of this fact permits an approximate prediction of the fatigue strength on the basis of the static strength. The change in the fatigue coefficient differs considerably in the two groups of plastics mentioned: The relative decrease of strength is much more rapid in the case of unfilled plastics than in glass-reinforced plastics. Considering the permanent downward tendency of the fatigue curve, and thus also the relativity of the index (σ or K), it is more suitable to take 10^6 stress cycles as a basis than 10^7 cycles. This enables testing periods to be shortened greatly without impairing the results. In order to estimate the rate of decrease of the index, an additional basis of $10^4 - 10^5$ stress cycles may be used. The index of fatigue strength is strongly influenced by the cross-section of the sample. This complicates the evaluation of fatigue properties and comparison of test results for products of different cross-sections. The composition of the material has a much slighter influence on the destruction energy in the case of repeated impact stresses than in the case of usual impact-strength tests (single impact). Basing on the relative energy of a severally repeated impact (with reference to impact

strength) it is possible to select those molded materials for which this energy is substantially higher than for most other plastics, including glass-reinforced plastics. The materials are selected on the basis of a criterion different from the one used in harmonic stresses, in which the durability and not the work into destruction is compared. S. N. Zhurkov is mentioned. There are 6 figures, 2 tables, and 22 references: 12 Soviet, 9 US, and 1 German. ✓

TITLE: Long-time strength of plastics

PERIODICAL: Elasticheskiye massy, no. 7, 1961, 60-63

TEXT: This is a review of publications on the long-time strength of plastics. The equation by S. N. Zhurkov et al. (Ref. 1: ZhTF, 23, no. 10 (1953). Ref. 2: ibid., 25, no. 1 (1955)) is given:

$$\tau = \tau_0 \exp[(U_0 - \gamma\sigma)/RT] \quad (1),$$

where τ is the long-time strength; τ_0 a constant almost independent of the material and approximately equal to the vibration period of the atoms in the molecule ($\tau_0 \approx 10^{-12}$ sec); U_0 a constant almost equal to the activation energy of thermochemical destruction; and γ a constant depending on the structure of material, which becomes smaller as the orientation increases, and larger on plasticizing. Results of other scientists are presented.

Card 1/3

21751

S/191/61/000/007/009/010

B101/B215

Long-time strength of plastics

especially data on glass-reinforced plastics. The difference between short-time and long-time tests is mentioned. In glass-reinforced plastics, the long-time strength after 1000 hr averages $2/3$ of the short-time strength, and $1/2$ in non-reinforced plastics. Papers by A. W. Thompson (see below), B. Pusey (see below), and R. C. Hooper (see below) on glass-reinforced epoxy resins are mentioned. Simplification of the complicated long-time test by extrapolation or, according to S. Goldfein (see below), by temperature increase according to the equation $T = (20 + \log t) = \text{const}$ (5) is discussed. Comparison of long-time strength and fatigue strength (by cyclic loading) shows that in the latter case, the strength is considerably reduced probably due to local heating. Under all test conditions, reinforced plastics generally show higher values than non-reinforced plastics. A. P. Aleksandrov, Tomashevskiy, and a report made by Yu. S. Lazurkin at the Conference on the Strength of Polymers and Polymer Materials, Moscow, May 16-18, 1960, are mentioned. The authors thank T. N. Kryuchenko and D. I. Verizhnikova for compiling publications on glass-reinforced plastics. There are 5 figures, 3 tables, and 24 references: 11 Soviet-bloc and 13 non-Soviet-bloc. The most important references to English-language publications read as follows: A. W. Thompson,

TITLE: Use of machine MRS-2 for fatigue tests of rigid plastic

SOURCE: Zavodskaya laboratoriya, v. 30, no. 10, 1961, 1269-1270

SOURCE: Zavodskaya laboratoriya, 1957.

TOPIC TAGS: plastic, fatigue strength, planar deflection, pulsating strain/ MHS 2 machine

ABSTRACT: Special adaptations were prescribed and designed for use in testing rigid materials with testing machine MRS-2. The adaptations are proposed for two modes of deformation: planar deflection and pulsating strain. In Fig. 1 on the Enclosures a schematic of the planar deflection adaptation is shown. Here 1 is a rigid plank, attached at one end to a fixed vise of the machine, and hinge-connected (through ball-bearings 2) by a tie bar 3 with clamp 4. The specimen 5 in the form of a two-sided blade is attached to clamps 4 and 6. Clamp 6 is attached to the machine's movable vise and can move in an up-and-down motion of given amplitude. The hinge feature is supposed to prevent undesired secondary stresses in the specimen. Figure 2 on the Enclosures shows the second adaptation, wherein 1 is the upper (fixed) machine lock in which is drilled a slot for casing 2, which serves as a guide for rod 3, hinge-connected at the lower end with clamp 4 holding the specimen 5. At its lower end the specimen is held by the movable vise 6 of the machine; each oscillation of the specimen is limited by the stop 7.

TITLE: Long term resistance of plastics to dynamic stress

SOURCE: Chemicky prumysl, no. 11, 1964, 589-594

TOPIC TAGS: wear resistance, fatigue strength, plastic durability, durability testing, plastic additive, abrasive strength

ABSTRACT: The authors have published several previous articles on this subject, mostly in Russian journals. The present article is therefore a general summary of their research. They point out that the resistance of plastics to mechanical wear and fatigue depends on the course of both mechanical and mechanical-chemical destructive processes. Abrasion and friction both cause wear. The tests described were carried out with abrasives and plastics in a way which was similar to wear as it occurs in practice, so that the experimental results can readily be applied to industrial conditions. The durability of plastics increases with hardness and duration of testing. Since fatigue also plays a role, additives are recommended to slow down the destructive processes, but no specific additives are discussed. Cooling during stress increases resistance to fatigue. During cyclic stress,

TITLE: A Calculating Machine for Controlling Arc-Furnace Duty (Vychislitel'noye ustroystvo dlya upravleniya rezhimom dugovoy pechi)

PERIODICAL: Elektrichestvo, 1958, Nr 5, pp. 15-20 (USSR)

ABSTRACT: At first an analysis of the controlling method of the electric operation of arc-furnaces according to the ratio between amperage and voltage in the phase is given, which now is everywhere in use. It is shown that it is useful to abandon this method and to change over to the controlling method by means of calculating machines. In these the power of effective electric energy supplied to the furnace is controlled. This method is based on the maintenance of the equations (1), (2) and (3). A scheme for an electromechanical variant of a calculating machine for one of the furnace phases is given. By means of a

Card 1/3

A Calculating machine for Controlling Arc Furnace Duty 105-58-5-4/28

diagram the controlling character in the absence and in the presence of the calculating devices is illustrated. The contradiction between the necessity of a quick removal of the produced deviation of power from the nominal value - and the necessity of a relatively slow compensation of the produced deficiency easily can be removed, when the employed electrodynamic controller is characterized by a maximum high-speed effect, whilst the velocity of the transients (determined by the effect of the calculating machine) is tuned in within the demanded limits at the expense of controlling the amplifier factor of the integrating member. The calculating device reacts to all excitations causing a deviation of the power from its given mean value. The practical experience with the calculating machine shows that during melting at $\tau = 10$ sec the variation of the real current caused by excitations does not exceed $\pm 10\%$ of the arc-current mean value. The one-year lasting test operation of the calculating machine showed that during complicated melting processes the machine guarantees an energy supply with an error not exceeding 2% . By the aid of the

Card 2/3

A Calculating Machine for Controlling Arc-furnace Duty 105-58-5-4/28

calculating machine it was possible to diminish the asymmetry of electroenergy distribution between the phases of a 20 t furnace by the 2,5-fold. The following persons took part in creating the electron calculating machine: A. A. Fel'dbaum, Doctor of Technical Sciences, L. N. Fitsner, Candidate of Technical Sciences, Yu. M. Alyshev, Engineer, L. I. Shevchenko, Engineer. There are 5 figures and 5 references, which are Soviet.

TITLE: On fatigue properties of capron and caprolon 15 15 15

SOURCE: Mekhanika polimerov, no. 2, 1965, 118-122

TOPIC TAGS: capron, fatigue strength, caprolon, polymer, plastic

ABSTRACT: The purpose of the investigation was to test the fatigue properties of two important thermoplastics which find wide application in the machine industry, i.e., capron and caprolon. Two varieties of caprolon were investigated: (A)- polymerized in presence of sodiumcaprolactam and acetic anhydride; (B)- polymerized in the presence of sodiumcaprolactam and carbon dioxide. Both varieties were compared with capron "B". The fatigue properties were determined at console buckling, at a frequency of 1000 cycles/min at 20C and at the temperature of self-heating. It was found that both caprolons had identical fatigue properties, and on the basis of 10^6 cycles both caprolons had a 70%, i.e., 300 kg/cm² greater fatigue
Card 1/2

L 61462-65

ACCESSION NR: AP5012433

strength than capron "B". The results of self-heating experiments are in complete agreement with those of S. B. Ranter and V. I. Korobov (Mekh. pol., 1965 (v. pechat)). The critical self-heating temperature for caprolon at 290 kg/cm² load and for capron at 165 kg/cm² load was found to be ΔT_c 15C. The specimens undergo rapid destruction after reaching the critical temperature. The critical temperature was found to have a definite value and was independent of the load, the frequency, and heat removal. It is concluded that heat removal leads to an increase in the fatigue strength of both plastics. The fatigue strength of a caprolon specimen cooled by an air stream exhibited a 22% increase in fatigue strength. Orig. art. has: 2 tables and 3 graphs.

Title : Connection Between Thermal Stability and Chemical Structure of Dielectrics.

Orig Pub : Strojníelektrotechn. časop., 1957, 8, No 1, 10-17

Abstract : A survey of data on the dependence of the thermal stability of high molecularorganic dielectrics and their chemical structure. The authors discuss briefly the structural variations that occur upon heating, and give ideas concerning the degree to which they depend on the individual elements of the structure.

AUTHOR: Stipanić, Ljubo, Engineer and Chief of Electrical
Section (Rijeka)

TITLE: Reconstruction of the Port of Rijeka

PERIODICAL: Tehnika, 1959, Nr 1, pp 134-140 (YUG)

ABSTRACT: The author describes in detail the port of Rijeka before the War and the damage inflicted upon this Port by the retreating German army. Systematic reconstruction of the Port has been in progress since 1945. The construction of the new Sušak breakwater lasted from 1949 to 1956. This breakwater is 32 m long, 18 m wide, it has 3 railway tracks, 2 wharves for ocean liners, and 6 new 5-ton cranes which can operate with hooks or grabs. Reconstruction of the Barčić wharf lasted 3 years, of the "10 rujan" and "Obala jugoslavenske mornarnice" piers and Vladimir Nazor wharf 4 years and of the "29 Novembar" wharf

of individual piers, number of cranes on each pier and the amount of storage space available are given in the article. The Port is equipped with portal, semi-portal and floating cranes which were either purchased from Hungary and Holland or produced by the "3 maj" Shipyard in Rijeka, such as the six 5-ton semi-portal cranes installed on the Sušak breakwater. The total number of cranes in the Port is 47 and the number of various vehicles operating in the area is 300. The Port has 3 rescue ships and various types of repair shops. 90% of the total railroad tracks have been laid since the war. Non-built up areas of the Port have been asphalted, drains laid and new underground power, telegraph and telephone lines laid. The electrification of the Port has been modernized, 4 new transformer stations constructed and 3 more planned. A new telephone exchange with

Title : Bora in the Karst Area and Windbreak Forest Belts

Orig Pub : Shumarstvo, 1956, 9, No 8-9, 487-496

Abstract : The nature of the dangerous bora storm wind is characterized and its influence on the soil and vegetation is described. The possibilities of weakening the killing effect of the boras by means of shelterbelts are examined and data are cited from literature on the windbreaking effectiveness of different types of windbreak plantations. The most suitable constructions of windbreaking forest belts are indicated, and the criteria of the selection of tree species with the view to their suitability for the ecological conditions of Karst are characterized. -- I. A. Bashkirov.
